Geographic Longitude 79° 16'W

Geomagnetic Latitude 55° .0 N
Geomagnetic Longitude 347° .0 E

Officer-in-Charge: W. E. Ross

Assistant: F. Furnell

1940-1941

Introduction

The year 1940 notes the 100th anniversary of the establishment of Toronto magnetic observatory and the 42nd anniversary of its removal to Agincourt.

Instruments

The same absolute instruments continued in use, namely, Elliott magnetometer No. 48 for declination, a Schuster-Smith electrical magnetometer for horizontal intensity, and Toepfer earth inductor No. 89 for inclination.

The corrections adopted for use in reducing observations to International Magnetic Standard are as follows:

for D, I.M.S. = Elliott 48 -0'.8

for H, I.M.S. = Schuster-Smith + 0.0 γ

for I, I.M.S. = Toepfer 89 -0'.15

Variometers in operation were: a Kew-type set; a la Cour set of normal speed and sensitivity; and a la Cour quick-run set of normal sensitivity. In 1940 the principal variometers were the Kew type for horizontal intensity, the la Cour normal for vertical intensity, and the Kew for declination except in February and July when instrumental difficulties led to the use of the la Cour normal. In 1941 the principal variometers were those of the la Cour normal set.

Scale coefficients for the la Cour normal set in 1940 and 1941 were: D = 0'.91/mm; H = 5.11 γ /mm; and Z = 5.90 γ /mm. Kew coefficients used in 1940 were: D = 1'.28/mm; H = 6.50 γ /mm January to March and 4.84 γ /mm during the remainder of the year; and Z = 10.0 γ /mm. In 1941 these latter coefficients were the same for D and Z and for H the value 4.84 γ /mm was used January to July and 4.92 γ /mm during the remainder of the year.

The root mean square values of the observed minus adopted photographic base-line values in 1940 were for D, $\pm 0'.5$; for H $\pm 3\gamma$; and for Z $\pm 17\gamma$. In 1941 the values were for D, $\pm 0'.9$; for H $\pm 5\gamma$; and for Z $\pm 26\gamma$.

Magnetic Reductions

The mean hourly, daily, and monthly values of horizontal intensity, declination, and vertical intensity together with daily extreme and range values of these elements and their diurnal inequalities are given in Tables 1 to 57 of each year.

The tables of daily extremes supply information pertinent to the magnetic character of the days, months, and year. The ranges in extreme values recorded in 1940 were; for H, 859 γ ; for D, 2° 28.1'; and for Z, 1697 γ . In 1941 the ranges for the year were; for H, 851 γ ; for D, 3° 29.7'; and for Z, 1552 γ . The ranges in D are equivalent to ranges of 659 and 933 γ , respectively, in the component of intensity perpendicular to the magnetic meridian. It is of interest to note that in 1930, when the preceding maximum disturbance of the earth's magnetic field occurred, the range for the year in H was 873 γ ; in D, 1° 51.8' or an equivalent range of 506 γ perpendicular to the magnetic meridian; and in Z, 926 γ .

The monthly and yearly mean values of H, D, Z, X, Y, I, and F for 1940 and 1941 that follow are based on mean hourly values for H, D, and Z. Values of X, Y, I, and F are computed from H, D, and Z.

A list of yearly values from 1917 to 1941, inclusive, completes this section of the 1940-1941 record.

K-indices and character figures have been supplied regularly to the Association of Terrestrial Magnetism and Electricity of the International Union of Geodesy and Geophysics for inclusion in their *Geomagnetic Indices C and K* bulletins.
