

## October Mean Daily Minimum and Maximum Temperatures

---

### Abstract

In October, longer nights and a return to below-freezing minimum temperatures is evident across most of Canada except for coastal British Columbia, southern Ontario and Quebec and most of the Atlantic Provinces. Much of southern Canada experiences maximum temperatures in October above 10°C, whereas maximum temperatures across most of the northern territories are below zero. The map shows the mean daily minimum and maximum temperatures for October.

---

Longer nights and a return to below-freezing minimum temperatures are evident across most of Canada except for coastal British Columbia, southern Ontario and Quebec and most of the Atlantic Provinces. Normal minimum temperatures in October of -10°C or colder are prevalent across most of Nunavut, the Mackenzie Delta and the northern Yukon.

Much of southern Canada experiences maximum temperatures in October above 10°C. However, across most of Nunavut, the Northwest Territories and the Yukon, maximum temperatures are below 0 °C. Only the southern portions of the Yukon and the Northwest Territories have maximum temperatures in October that exceed 0°C.

### Data Source and Methodology

The 1971 to 2000 temperature climate normals were calculated by Environment Canada in a manner consistent with the methodology of the World Meteorological Organization. For temperature, a monthly maximum (minimum) average was computed from the daily maximum (minimum) temperature observations. The normal is a simple arithmetic average of the monthly minimum or maximum temperatures for the specified period. These spatial models have been developed using the thin plate smoothing spline algorithms of ANUSPLIN, which is a mathematically sophisticated approach to generating climate maps at varying spatial and temporal scales. The Canadian Forest Service has been working in partnership with several staff in Environment Canada's Meteorological Service of Canada, the Australian National University (the creator of ANUSPLIN) and others to develop a variety of climate models that cover both Canada and North America.

## Definition of underlined term

**Climate normals:** Climate normals are used to summarize or describe the average climatic conditions of a particular location.

---

## Map Sources

### October Mean Daily Maximum Temperatures (°C)

The mean daily temperatures for the summer season are represented by the month of July, middle of the summer season and are intended to represent average conditions only, as the weather in any given year during summer would or could vary. The 1971 to 2000 temperature climate normals were calculated by Environment Canada and the monthly maximum average was computed from the daily maximum temperature observations. Spatial models have been developed using the thin plate smoothing spline algorithms of ANUSPLIN by the Canadian Forest Service in partnership with several staff in Environment Canada's Meteorological Service of Canada and the Australian National University (the creator of ANUSPLIN).
